## Abstract

The zeolite mineralization was found in the forest area on a steep hill Pustý zámek, ca 1 km S of the settlement Milířsko, 2.5 km SE of Těchlovice village at right riverside of Labe (northern Bohemia, Czech Republic). It consists of two dyke-intrusions of camptonite type belonging to the so-called Roztoky dyke swarm. Heulandite-Ca, stilbite-Ca and scolecite are the most prominent zeolites of this locality. Heulandite-Ca forms white, pearly lustrous transparent crystals up to 1 cm in size or sheen twins sized up to 2 cm. The unit-cell parameters of heulandite-Ca refined from the powder X-ray data are:  $a = 17.725(2)$ ,  $b = 17.822(2)$ ,  $c = 7.4306(9)$  Å,  $\beta = 116.33(5)^\circ$ , and  $V = 2103.7(4)$  Å<sup>3</sup>. Its chemical analyses correspond to the empirical formula  $K_{0.85}Na_{0.48}Ca_{2.88}Ba_{0.02}Sr_{0.83}(Al_{8.86}Si_{27.15})O_{72}\cdot24H_2O$ . Scolecite occurs in white to colourless hemispherical aggregates up to 1 cm in size and fan-like clusters in yellowish aggregates of chabazite. Its unit-cell parameters refined from the powder X-ray data are:  $a = 18.496(8)$ ,  $b = 18.957(6)$ ,  $c = 6.522(3)$  Å,  $\beta = 90.55(7)^\circ$  and  $V = 2286.7(13)$  Å<sup>3</sup>. Chemical analyses of this zeolite correspond to the empirical formula  $Na_{0.22}Ca_{0.88}(Al_{1.93}Si_{3.06})O_{10}\cdot3H_2O$ . Stilbite-Ca occurs as slightly yellowish aggregates up to 2 cm in size. Its unit-cell parameters refined from the powder X-ray data are:  $a = 13.640(1)$ ,  $b = 18.240(1)$ ,  $c = 11.2741(9)$  Å,  $\beta = 128.01(1)^\circ$  and  $V = 2210.3(3)$  Å<sup>3</sup>. Chemical analyses of stilbite-Ca correspond to the empirical formula  $Ca_{4.20}Na_{1.19}K_{0.25}(Si_{26.38}Al_{9.56})O_{72}\cdot28H_2O$ . Analcime, chabazite-Ca and meiolite occur as additional zeolites at this site. Crystals of K-feldspar (orthoclase), unknown yet in zeolite associations of České středohoří mountains, has been found in one of the dyke intrusion.

**Key words:** analcime, heulandite-Ca, chabazite-Ca, scolecite, mesolite, stilbite-Ca, orthoclase, powder X-ray diffraction data, unit-cell parameters, chemical composition, Milířsko near Těchlovice, Czech Republic
